Abstract

In the article, national education, first of all, feels the internal experiences related to the mentality of the learner, the differentiation of teaching, the creation of educational programs imbued with the national spirit, the well-rounded personality of the teacher. - influences on education and forms the basis of educational and organizational activities.

Key words

education, educational technologies, national education, morality, technology.

In order for our country to become one of the developed countries, the goal of accelerating public education and increasing its effectiveness requires us to use advanced pedagogical measures and technologies. As we step on the path of building a modern state and ensure a consistent transition from a strong state to a strong civil society, only those who deeply understand the need for the harmony of national and universal values, possess modern knowledge, intellectual potential and advanced technologies We have always imagined that only people can achieve the strategic development goals set before us" [1].

The reform of the continuous education system in the Republic of Uzbekistan is aimed at forming the young generation with high professional culture, creative and social activity, independent participation in social and political life, and the ability to think freely. This, in turn, requires increasing the level of scientific knowledge and activity of students. In the process of teaching subjects in higher education institutions, it is important to increase students' interest in the lesson, their independence and it is desirable to widely use innovative methods that help them to receive interactive education aimed at developing their activity and logical thinking. After all, logical thinking based on innovative technologies is one of the most important factors in the development of the continuous education system. They are manifested in the integrated system of various initiatives and innovations

that lead to certain changes in the educational process, enriching the content, quality and effective organization of education. The rapid development of science, technology and technology, the penetration of new techniques and technologies into all layers of society, the use of information technology tools in all state and non-state institutions require continuous education from teachers. The activities of teachers are multifaceted, and they have to perform the roles of managers, communicators, guides, organizers, and evaluators.

The role of the teacher in the teaching process is very complex and has its own historical and modern aspects. If in previous times teachers were required to provide only modern knowledge, now they are also required to provide educational, cultural-spiritual, political and practical knowledge. Raising our children, who are the future of our country, to be polite and noble is the demand of the times [2]. Therefore, the main goal is to take care of a well-rounded person, his work, life, exemplary maturity. National education, first of all, is the basis of internal experiences related to the learner's spirit, differentiation of teaching, creation of educational programs imbued with national spirit, and educational-organizational activities.

If we use the thoughts and advices of our scholars, who are among the treasures of world culture, in educational activities, we will achieve the desired goal. Good education is a priceless spiritual wealth of a person. This can be provided for the young generation only when educational activities are organized harmoniously. It is known that the perfection of a person is not determined by his external appearance, but rather by his spiritual world. The development and future of the society depends on the spiritual and material maturity of the people living in this society. The future is bright with spiritually poor it is known that society cannot be built is a fact of life. Therefore, it is necessary to spend all our energy and heart on education. So, our future, our hopes, our confidence, our entire existence depends on education, the effectiveness of the work carried out by the educator-coach, how skillfully he can organize educational hours and extracurricular activities.

In a situation where real human relations between students are extremely necessary, the importance of moral and etiquette lessons in educational hours is important. It is up to educators to form such qualities among young people. If a teacher is uneducated, others like him will gather around him, because they will imitate him. If this situation is not prevented, lack of education can take deep roots. Usually, we make two mistakes: the first is that young people are still young and they are often not trusted, and the second is that we do not always follow the

advice of the elderly. Young people have great initiative and energy, which is related to confidence and aspiration for the future. As for the elderly, they have experienced a lot of heat and cold on their way to life and gained rich experience. A positive result can be achieved only when the initiative, energy and enthusiasm of young people are connected with the rich life experience of the elderly.

It is necessary to form a factor of humanity in young people. Therefore, the human factor has become a frequent topic of discussion recently. But sometimes we cannot fully understand its essence. The human factor is the spiritual development of a person. Educational hours can be said to be a demonstration of creative research and pedagogical skills of trainers. It allows students to learn self-management, democratization of educational and organizational work, humanization, free communication between teachers - students - coaches [3]. Nowadays, we should look at our historical, national-cultural heritage, traditions, values, which have taken a rightful place in the spiritual treasure of mankind, and use them effectively in educating the young generation. The human factor always plays a decisive role. Humaneness means focusing the entire activity of the educational institution on the teacher and student, respecting its essence, appreciating it, expressing trust, correctly understanding their demands and needs, personal interests in the process of formation [4]. This is to allow him to realize his full potential, to realize himself, to fully cover the life of the learner in the place of knowledge. Improving educational work is the key to new pedagogical thinking. Its quality, standard and effectiveness depend on the work of the teacher. Improving educational work does not consist only in changing the nature and description of the relationship for the learner, but it means to educate him in the education of dignity, morality, kindness and compassion.

Improving mainly: the pedagogical process, which includes lessons, educational hours, extracurricular educational activities, and its essence, content, forms and methods, to be improved with a high quality index, to form the interests of teachers and students, to develop a personal way. It is determined and implemented according to the achievements of the acquired experience. However, the personal quality of the teacher depends on the level of culture of his creativity and the opportunity given to him to realize his professional skills. The improvement of educational work consists in expanding the students' existing ideas about man and society, their interaction with mother nature, and the formation of concepts of responsibility in front of them.

In conclusion, it can be said that in the process of conducting lessons and other educational activities, it is important to teach and teach about the masterpieces of

our national culture, our customs, mannerisms, paintings, and our best traditions. It is necessary to teach to acquire skills and skills, to take an example. In particular, discussions with them about our national culture are on topics such as "Uzbek folk customs and traditions", "Our great ancestors", "Uzbek scholars and thinkers", "Masterpieces of manners", "Navroz holiday". if carried out, it will instill in learners a love for our values. Before us is the urgent task of educating the culture of interaction between the teacher and the learner, the desire to learn science and craft. We should not spare all our energy and effort to forcefully promote the single requirement for every student and to achieve its application in real life and marriage.
